

Stress-Induced Anhedonia: Recovery Trajectory (Experiment A)

Statistics: PFC decline $t=9.15$, $p<0.001$, $d=2.44$
Recovery trajectories:
7-day: PFC +9%, Exploration +17%
30-day: PFC -7%, Exploration -8% (near-baseline)

Key finding: Stress-induced anhedonia persists weeks-months but typically resolves with stressor removal
